

## Using the definition to calculate correlation

Freshmen at the Webb Schools go on a backpacking trip at the start of each school year. Students are divided into hiking groups of size 8 by selecting names from a hat. Prior to departure, each student's body weight and backpack weight are measured (both in pounds). Here are data from one hiking group in a recent year:

Body weight (lb):	120	187	109	103	131	165	158	116
Backpack weight (lb):	26	30	26	24	29	35	31	28

We will use these data to show how to calculate the correlation using the definition and the list features of the TI-83/84/89.

- Begin by entering the body weights (x-values) in L<sub>1</sub>/list1 and the backpack weights (y-values) in L<sub>2</sub>/list2. Then calculate two-variable statistics for the x- and y-values. The calculator will remember all of the computed statistics until the next time you calculate one- or two-variable statistics.

TI-83/84

TI-89

- Press **STAT**, choose **CALC**, then **2:2-Var Stats**.
- In the Statistics/List Editor, press **F4** and choose **2:2-Var Stats**.

- Complete the command **2-Var Stats** L1, L2 and press **ENTER**.
- In the new window, enter list1 as the Xlist and list2 as the Ylist, then press **ENTER**.

```
2-Var Stats
x̄=136.125
Σx=1089
Σx²=154665
Sx=30.29586252
σx=28.33918444
↓n=8
```

```
2-Var Stats-
Xlist: L1
Ylist: L2
x̄=136.125
Σx=1089
Σx²=154665
Sx=30.2958625181
σx=28.3391844449
n=8
σy=28.625
↓Sy=229
```

```
2-Var Stats
↑ȳ=28.625
Σy=229
Σy²=6639
Sy=3.461523199
σy=3.237958462
↓Σxy=31756
```

```
2-Var Stats-
Xlist: L1
Ylist: L2
↑ȳ=28.625
Σy=229
Σy²=6639
Sy=3.46152319899
σy=3.23795846175
σxy=31756
MinX=103
↓Q1X=142.5
```

- Define L<sub>3</sub> = ((L<sub>1</sub> - x̄)/s<sub>x</sub>) and L<sub>4</sub> = ((L<sub>2</sub> - ȳ)/s<sub>y</sub>)
- Define list3 = ((list1 - x̄)/s<sub>x</sub>) and list4 = ((list2 - ȳ)/s<sub>y</sub>)

from the home screen as shown. Note that x̄, ȳ, s<sub>x</sub>, and s<sub>y</sub> can be found under VARS/5:Statistics (in the VAR-LINK menu on the TI-89).

```
((L1-x̄)/Sx)→L3: (
(L2-ȳ)/Sy)→L4
(-.758336677 .39722)
```

```
list1-x_bar → list3 : 1/
SX
(-.758336676977 .39722)
STATVARS RAD APPROX FUNC 1/30
```

- Go into the Statistics/List Editor to look at the results. The first student listed has a body weight of 120 lb. and a backpack weight of 26 lb. In L<sub>3</sub>, we see that his standardized body weight is  $z = \frac{120 - 136.125}{30.296} = -0.53$ . In other words, his weight is 0.53 standard deviations below the mean body weight for this group of 8 hikers. In L<sub>4</sub>, we see that the z-score for his pack weight is  $z = \frac{26 - 28.625}{3.462} = -0.76$ . So his pack weight is 0.76 standard deviations below the mean backpack weight for the group.

L2	L3	L4	3

list3(1)	=-.53225089697902		

Using the definition to calculate correlation (*continued*)

- Define  $L_5 = L_3 * L_4$  (list5 = list3\*list 4 on the TI-89). Notice that most of the values in  $L_5$ /list5 are positive.

L3	L4	L5	5
-.5323	-.7583	.40363	
1.6793	.39722	.66705	
-.8953	-.7583	.67897	
-1.093	-1.336	1.4609	
-.1692	.10833	-.0183	
.9531	1.8417	1.7553	
.72205	.68611	.49541	

L5=L3\*L4

list2	list3	list4	list5

30.	1.6793	.39722	.66705
26.	-.8953	-.7583	.67897
24.	-1.093	-1.336	1.4609
29.	-.1692	.10833	-.0183
35.	.9531	1.8417	1.7553

list5=list3\*list4  
STATVARS RAD APPROX FUNC 5/11

- To finish calculating the correlation  $r = \frac{1}{n-1} \sum \left( \frac{x-\bar{x}}{s_x} \right) \left( \frac{y-\bar{y}}{s_y} \right)$ , we just need to add up the values in  $L_5$ /list5 and then to divide by 7. To do this, enter the command shown in the appropriate calculator screen. Press **ENTER** to see the correlation.

(1/(8-1))*sum(L5)
.7946926677

$\frac{1}{8-1} \cdot \text{sum}(\text{list5})$
.794692667734
(1/(8-1))*sum(list5)
